

SvanMOBILE

Application for Android® devices

SvanMOBILE is an Android application for devices running on Android platform extending functionalities of SVAN 977 / 979. SvanMOBILE allows to link measurement files from sound level meter to media files from smart-phones such as photos, video or audio recordings. Anyone who makes measurements in the environment will appreciate the fact that SvanMOBILE can be used to automatically add weather data and GPS position to report on the measurement. To communicate with SVAN 977 / 979 the Bluetooth

interface is used. It allows the user to trigger measurements, edit settings, rename files and view the results remotely. This solution is of great value in building acoustics measurements as it gives a live preview of the results and the option to start/stop the instrument from another location.

The association of SvanMOBILE data with the files from SVAN 977 / 979 instruments is supported by SvanPC++ software

Key features

- Application for Android platform
- Remote control over SVAN 977 or SVAN 979 with Bluetooth interface
- Remote Start / Stop / Pause of measurement
- GPS tracking with Google maps support
- Adding photos and voice comments to measurement files

Main applications

- Noise measurement in the environment
- Building acoustics
- Sound level measurements with tripods
